- I need a place to install, run, and manage my Kubernetes clusters.  
=> OpenStack, oVirt, VMware, AWS, GCE, Azure, etc.
- I need a way to provide strict isolation of my application containers.  
=> Katacontainers, gVisor

# What about existing workloads?

## CONTAINER INFRASTRUCTURE AND ORCHESTRATION

Container Application and Kubernetes orchestration as provided by OpenShift are becoming **the** standard for new applications.

# What about existing workloads?

## CONTAINER INFRASTRUCTURE AND ORCHESTRATION

Container Application and Kubernetes orchestration as provided by OpenShift are becoming **the** standard for new applications.

## VIRTUALIZED WORKLOADS

Virtualized Workloads are not going anywhere fast! Business reasons (cost, time to market) and technical reasons (older/different operating system)

# What about existing workloads?

## CONTAINER INFRASTRUCTURE AND ORCHESTRATION

Container Application and Kubernetes orchestration as provided by OpenShift are becoming **the** standard for new applications.

## VIRTUALIZED WORKLOADS

Virtualized Workloads are not going anywhere fast! Business reasons (cost, time to market) and technical reasons (older/different operating system)

## CONVERGING INFRASTRUCTURE

Existing solutions force us to manage both separately. How can we bring these two worlds closer together?

# Enter KubeVirt

# What is KubeVirt?

Technology enabling developer use of Kubernetes as a unified platform for building, modifying, and deploying applications residing in both containers and virtual machines in a common, shared environment.

Add virtual machines to your Kubernetes/OpenShift projects directly from the service catalog!

# What is KubeVirt?

- Drops directly into existing Kubernetes Clusters
- Takes as K8S-native an approach as possible
- Leverage Container Networking Interface (CNI), Container Storage Interface (CSI). and other K8S-native integrations.
- Apache License, Version 2.0

<http://kubevirt.io>

# Components

- **KubeVirt**

The virtual machine operator

- **Containerized Data Importer (CDI)**

Importing disks

- **OpenShift Web Console (Optional)**

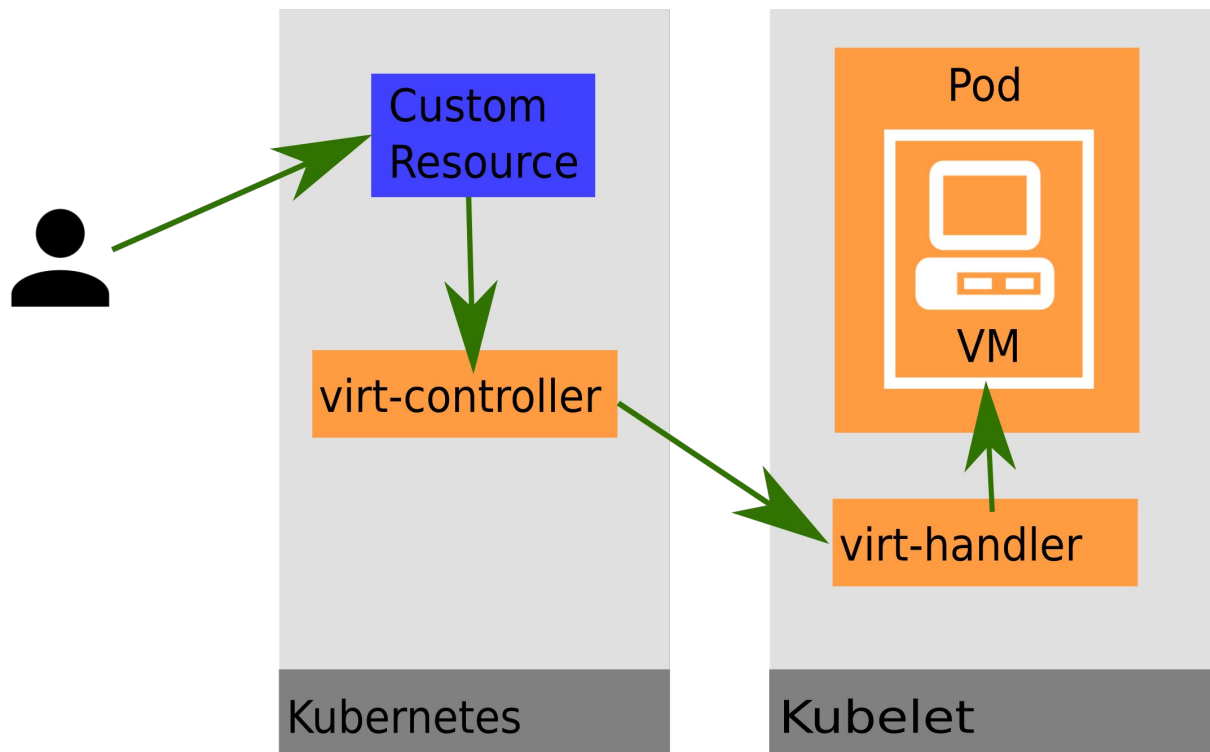

With UI extensions

- **Virt-v2v (APB)**

Importing a whole virtual machine

# High Level Architecture

# VirtualMachine Operator and API

- Virtual Machines have their own kind
  - Ability to express all common virtual machine parameters and actions
  - Targeted feature set is comparable to libvirt
- Implemented as a CRD
  - Inheriting authn, authz, client ool support, ...

```
apiVersion: kubevirt.io/v1alpha1
kind: VirtualMachine
metadata:
  name: vm-fedora
spec:
  domain:
    devices:
      disks:
        ...
      resources:
        requests:
          memory: 1024M
    volumes:
      ...
status:
  interfaces:
    - ipAddress: 172.17.0.12
  nodeName: localhost
  phase: Running
```

# Example Use Case

# Example Use Case: We have a VM!

# Example Use Case: Import

Import Using V2V or from an image.

# Example Use Case: New Functionality

# Example Use Case: Decomposition

A decorative graphic on the left side of the slide. It features a large, semi-transparent blue circle. Inside the circle, there is a photograph of a forest scene with tall evergreen trees. The bottom left corner of the slide shows a rocky, textured surface, possibly a mountain trail.

# Demo

# Demo

Pre-requisites:

- kubectl
- minikube/minishift

[http://kubevirt.io/get\\_kubevirt/](http://kubevirt.io/get_kubevirt/)

NB: Yes, we're running nested virt here - fine for getting started!

# Future Plans

- Operators for KubeVirt, Common Data Importer, etc.
- Additional VM life-cycle actions.
- Additional Networking options (Multiple Networks, SR-IOV).
- Add more flows to the UI.
- Turn-Key storage solutions.
- VM ReplicaSets, DaemonSets, etc.
- Initial Istio support.
