What Exactly is The Edge?

- There is only one universally accepted definition for The Edge

David Howell Evans

(Lead guitarist, U2)

What Exactly is The Edge?

“The edge is anything that’s not cloud.” — Keith Townsend, The CTO-Advisor

“The edge is the bumper of a car.” — Anonymous

“Edge computing is compute that’s closer to the consumer.” — Mark Imbriaco, Pivotal

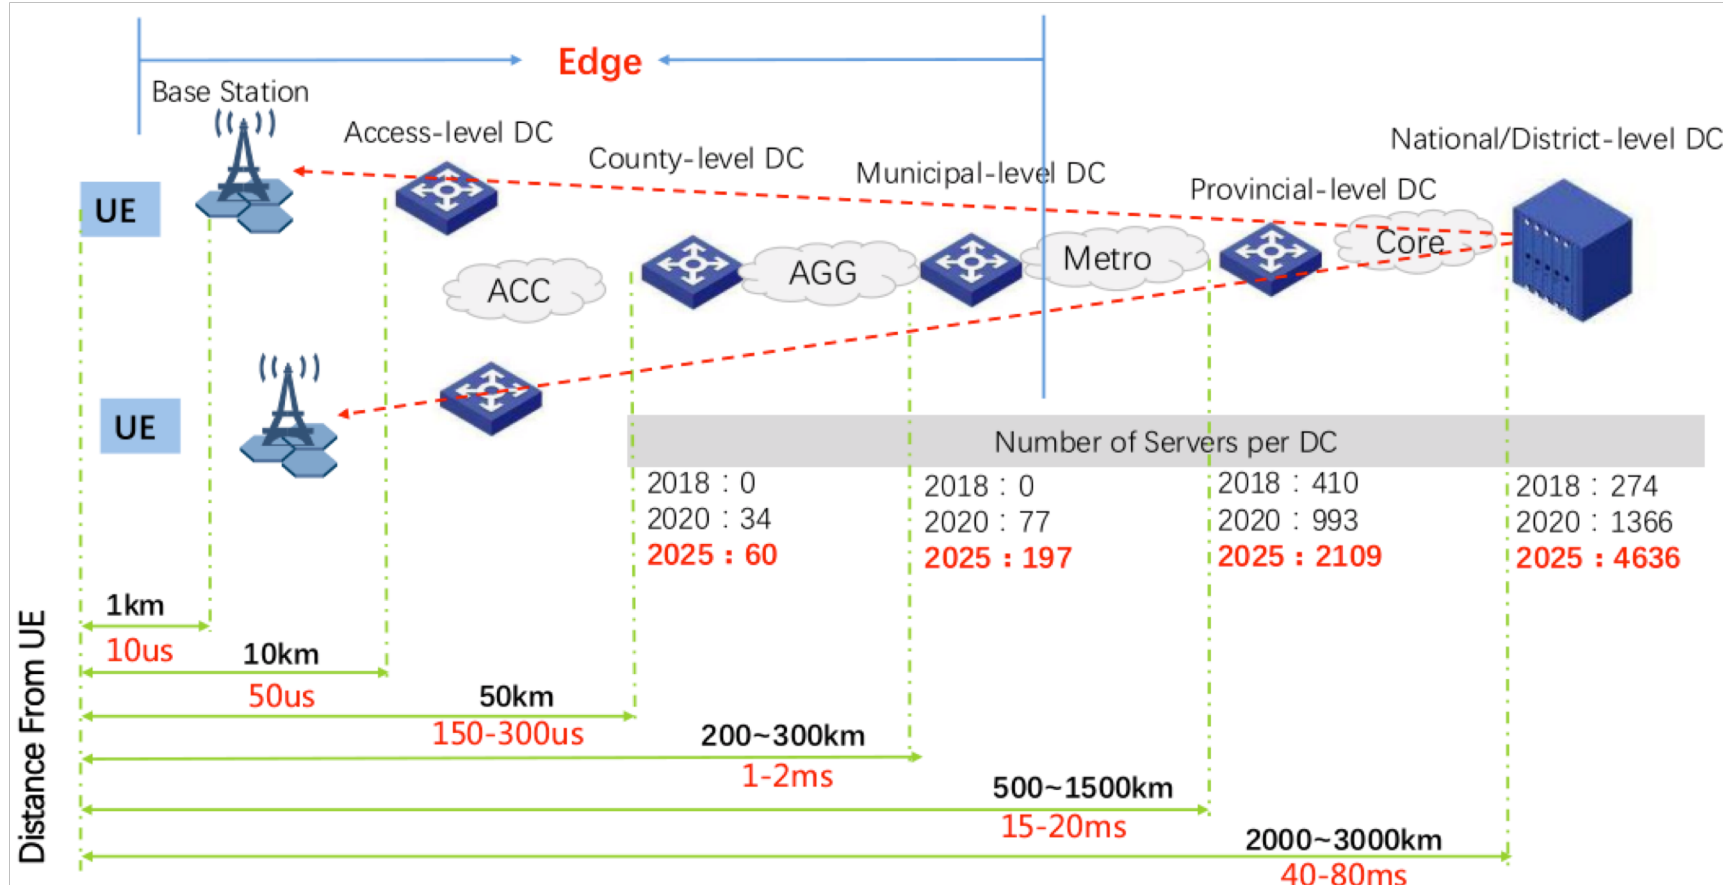

<https://www.linuxfoundation.org/blog/2018/06/edge-computing-just-got-its-rosetta-stone/>

Features For The Edge

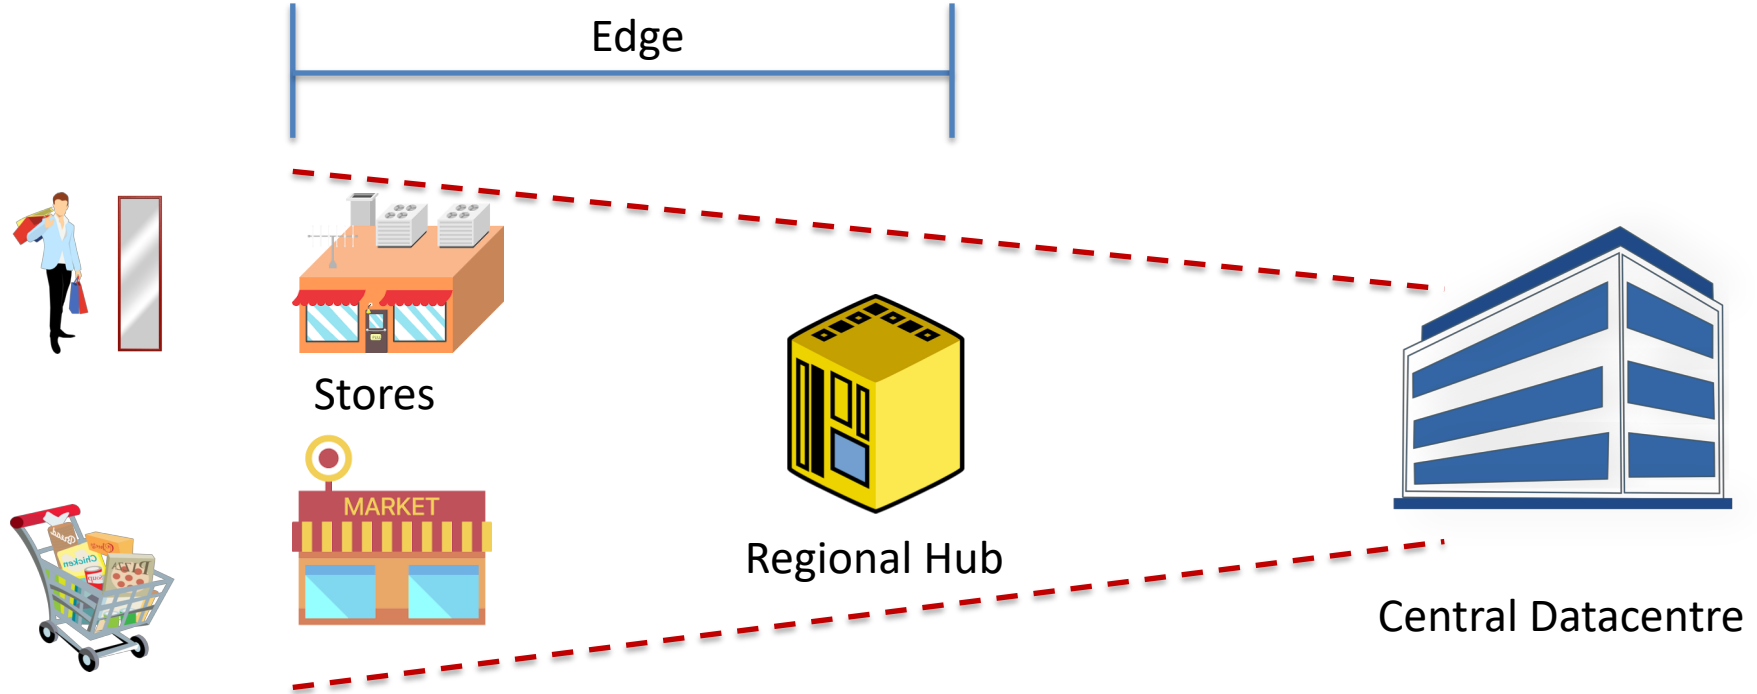

- Light weight control
- Resource Heterogeneity
- Remote provisioning
- Hardware/software acceleration
- Autonomous

Where Is The Edge? Telco China Mobile Example

Retail Example – Clip Art Only

Healthcare Example – Also Clip Art

And Why is This Important?

- Faster data processing and analysis
- Less network traffic (backhaul)
- Increased efficiency
- Lower costs
- Increased security/compliance
- Legacy interoperability

What's Missing from OpenStack?

- Scale (# of edge sites)
 - Single pane of glass at the regional datacentre
 - Services not multi-cloud aware
 - Availability when network not reliable
- Federation
 - Single source of truth for services
- Caching

What is OPNFV?

- Founded in 2015, became LF project 2018
- Integration with other open source projects to meet the needs of NFV requirements
- New Features
- Testing of the entire stack

What is OPNFV Doing?

- Established Edge WG
 - Solicit feedback from End User Advisory Group
 - Provide unified view of activities to collaborate and avoid duplication
 - Maintain list of perceived gaps in upstream
 - Develop position in regards to ETSI MEC

What is OPNFV Doing?

- Collaborating with upstream
 - Defining use cases, test cases
 - Keystone and Glance for edge testing
 - Seeking to integrate StarlingX as scenario
 - Define and create execution environments
- Creating Edge Deployment
 - Define Edge scenario for testing

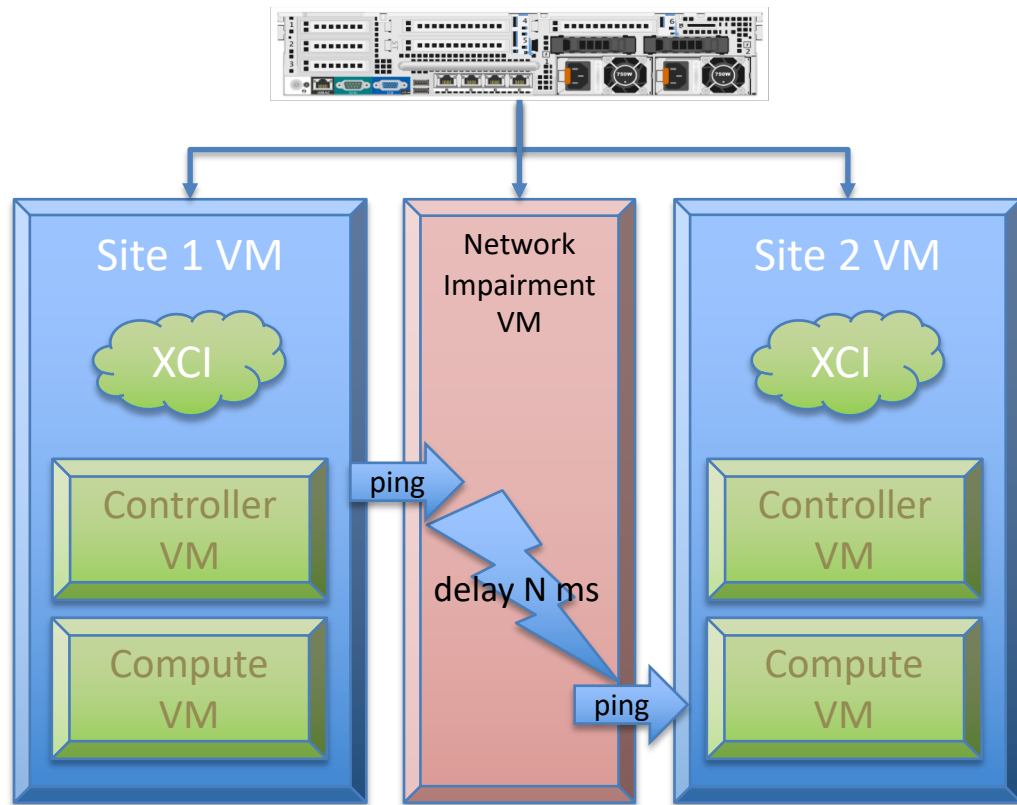

- Auto – ONAP integration
- C-RAN – Use case definition for mobile radio access networks
- Cloud Edge – Reference Platform
- Clover – VNF containerization
- DPACC – Data plane acceleration
- Rocket – Acceleration API

- Cross (X) Community Installer
- Based on Bifrost/Ironic
- OpenStack installation from Master
- Scale/sizing
 - Mini – everything in VMs on single server
 - HA – 3 controller, 2 compute bare metal

- OPNFV XCI
 - Mini flavour installs OpenStack from master in VMs
 - 2 full OpenStack environments in 1 server
- Impairment VM

- Work in progress
- Set up two sites with network impairment
- Deploy Keystone on both
- Regional site Keystone is IdP
- Edge site Keystone uses Shibboleth as SP

- Prove federation works
 - It does, but not the way originally envisioned
- Discover limitations
 - Authentication when network is down
 - Synchronization of passwords
 - Centralized limits enforcement

Glance Image Handling at the Edge

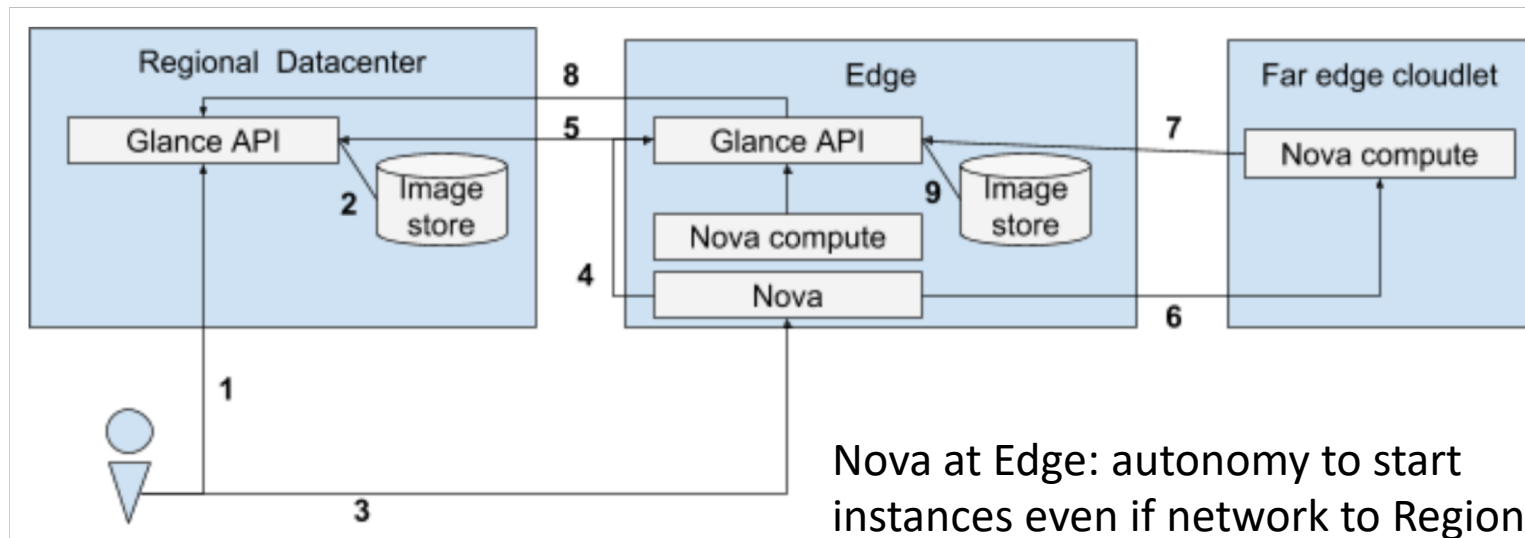

As a user of Glance, want to upload an image in the regional datacenter and boot that image in an edge datacenter: fetch the image to the edge datacenter with its metadata.

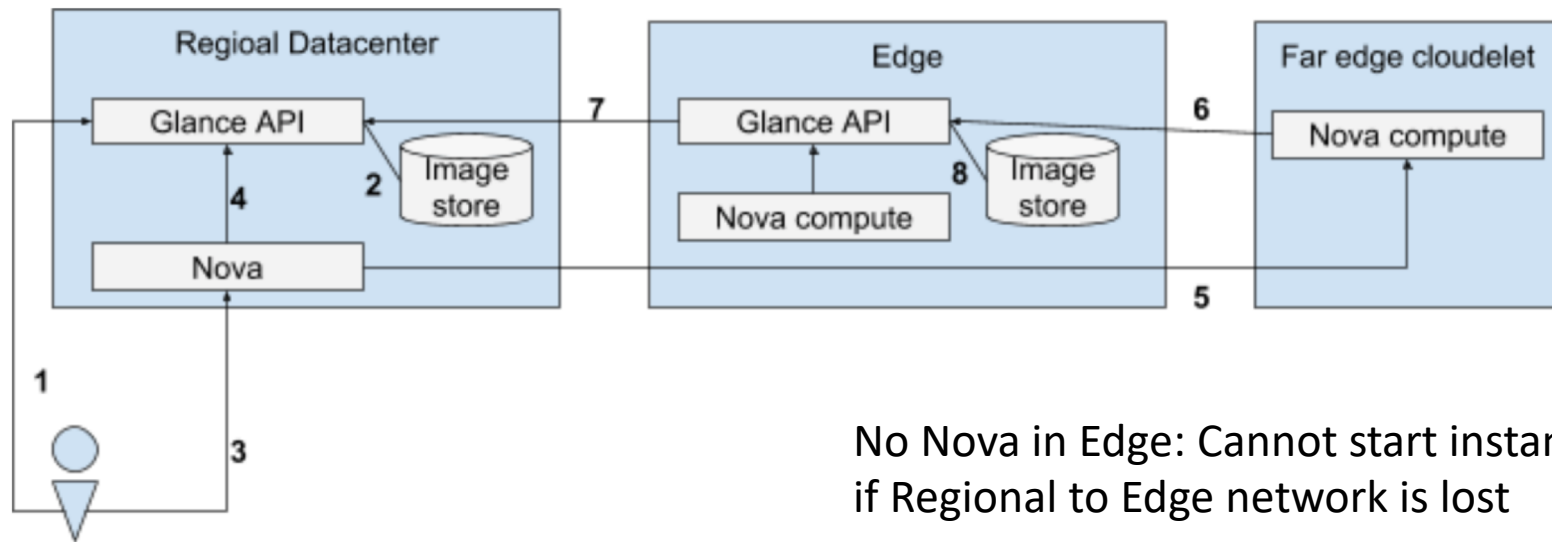

- Image distribution to edge sites
- How is Glance affected by
 - Latency? Packet Loss?
 - Interruption of network
 - Image Size?

Glance Image Caching – Distributed Control

Nova at Edge: autonomy to start instances even if network to Regional is lost

Glance Image Caching – Centralized Control

- Acceleration
- Containers and Kubernetes
- OpenStack - light weight
- SDN Controller
- Orchestration

Where Do We Go From Here?

- Participate!
 - OpenStack Edge Working Group
 - OPNFV
 - StarlingX
 - Akraino
 - Airship
